1. Introduction

This Biennial Report analyzes results from biological monitoring of Recycled Water (RW) projects in the Cypress Conservancy wetland ("Cypress") and Whooping Crane Conservancy ("Whooping Crane") wetlands in the Hilton Head Plantation community, Hilton Head Island, South Carolina, during the two-year period 2016-2017. This sustainable water reuse program has been in operation for the Hilton Head Public Service District (HHPSD) since 1986, and was first monitored under the SC Department of Health and Environmental Control National Pollution Elimination Discharge Permit (SCDHEC/NPDES) in 1998, the Baseline year in this report. RW was called "Reclaimed Water" in prior monitoring reports. RW (advanced-treated, dechlorinated effluent) is processed and distributed by Hilton Head Public Service District in two, large freshwater wetlands -- Cypress Conservancy and Whooping Crane Conservancy -- to (1) provide additional uptake and filtration of water and nutrients; (2) eliminate discharges to other waters, such as tidal streams; and (3) enhance the natural hydrology and ecological conditions of the receiving wetlands.

Since the baseline year, Ballantine Environmental Resources (BER) has conducted scientific measurements and reporting for the "Growing Season" (February 15-November 15) and "Dormant Season" (November 16-February 14). In compliance with the SCDHEC NPDES permit for this RW project, our monitoring has reported data for the overall ecological condition, hydrology, vegetation, wildlife, and any other factors that impact the RW Project. The Conclusions and Recommendations assess the status of the wetlands and provide recommendations for operational modifications, if applicable.

2. Site Description

2.1. HILTON HEAD PLANTATION RECYCLED WATER PROJECTS

The RW projects are located on northern Hilton Head Island, in southern Beaufort County, South Carolina. Both the Cypress and Whooping Crane wetlands are found within a 1.2 square mile area in the central-eastern section of Hilton Head Plantation, a nearly 4,000 acre residential community developed in 1972 (Figure 2-1).

2.2. CYPRESS CONSERVANCY

Cypress Conservancy is the last large stand of pond cypress and bald cypress trees on Hilton Head Island. It is part of the watershed draining into Skull Creek, a tidal waterway between Hilton Head Island and Pinckney Island National Wildlife Refuge. This freshwater wetland consists of two cells encompassing 50.8 acres (Figure 2-2). The western cell (35.8 acres) is a mixed forested, intermittently flooded system that contains the bottomland hardwoods, bald and pond cypress trees. The average elevation is 14 feet above mean sea level (MSL). RW is discharged into this "project wetland." Here, one inch of water equals 1 million gallons. The eastern cell (15 acres) receives no RW. This broad-leaved forested, saturated system has an average elevation of 15 feet MSL, and supports mixed pines, bottomland hardwoods, a declining stand of bald and pond cypress trees, and an active winter burrow colony for alligators.

2.3. WHOOPING CRANE CONSERVANCY

Whooping Crane Conservancy (Figure 2-3), formerly called "Whooping Crane Pond," is the island's largest and most ancient wetland basin (formed in the Pleistocene Epoch—10,000 to 1.8 million years ago). Its water drains into Port Royal Sound and Broad Creek, via Hilton Head Plantation's storm-water retention/detention system. Port Royal Sound is a large ocean estuary. Broad Creek is an incompletely drained tidal inlet, adjoining Calibogue Sound. Whooping Crane is a lacustrine, forested (old-growth and second-growth hardwoods) and emergent, permanently flooded system. Its average elevation is 13 feet MSL. Whooping Crane's 68-acre northern cell receives recycled water. In this wetland, one inch of water equals 1.85 million gallons of water. The southern cell (47.0 acres) is a lacustrine, forested (second growth hardwood) and emergent, seasonally flooded system. An average of 12.5 feet MSL, this cell does not currently receive regular RW flow. This area is comprised of bottomland hardwoods and intermittent shrubgrowth. It is also an active winter burrow complex for alligators. This cell serves as an overflow basin during high stormwater events, such as occurred in October 2015 and October 2016.

Figure 2-2. Site Map: Cypress Conservancy

Figure 2-3. Site Map: Whooping Crane Conservancy

3. Methodology

3.1. MONITORING SCHEDULE

As stipulated by the NPDES Permit No.SC0046191, amended October 24, 2005, BER monitored the project wetlands semiannually in 2016 and 2017.

3.2. SCIENTIFIC PROTOCOL

Since the Baseline we have used the line-intercept method of data collection. In the Cypress and Whooping Crane projects we maintain three line-transects spanning the width of each wetland. Permanent sampling quadrats are established at equidistant points (intercepts) on the transects. Figures 2-2 and 2-3 show the location of monitoring transects in the project wetlands.

Our collected field data includes:

- Water depth measured at each quadrat.
- Vegetation measured at each quadrat. We recorded the diversity, dominance, and density of canopy species in cen-acre (1/100 acre) quadrats. In the shrub and ground-cover stratum ("shrub/ground-cover"), we measured species diversity, dominance, and density in mil-acre (1/1,000 acre) quadrats.
- Wildlife: We identified macro-invertebrates in quadrats and along transects. We recorded fish species identified visually or by netting in appropriate habitats at stations. We also identified indicator vertebrates visually or physically (by vocalizations, "sign," tracks, or trails).
- Significant impacts: We documented wetland impacts from natural causes. Such impacts include drought, tropical and other storms, plant disease, invasive species, and wildlife activity. Man-induced impacts (e.g., trash dumping, mowing, vandalism) were also noted.

A detailed description of monitoring methods and calculations is provided in the 1996 and 1997 Annual Biological Monitoring Reports for the Cypress and Whooping Crane recycled water projects.

3.3. REPORTS

The current NPDES permit requires biennial reports. However, as needed by HHPSD, BER provides updates, memos, and outreach publications about the two recycled water projects. This current Biennial Biological Monitoring Report compares data collected in the growing and dormant seasons of 2016-2017 with conditions in the 1998 Baseline. Results are organized according to NPDES Parameters. We submit all reports to the Hilton Head PSD, which forwards the information to SCDHEC and other stakeholders. 4. Monitoring Results by NPDES Parameters 2016-2017 Hilton Head Plantation RW Project Hilton Head Island, SC NPDES Permit No. SC 0046191 (10-24-05) Cypress Conservancy and Whooping Crane Conservancy Wetlands 2016-2017 Conditions Compared with the Baseline Year 1998

Parameter A.

Hydroperiod

A-1. Total Loading. RW and rain compared to the Baseline and 40-year average rainfall (Hydroperiod).

The 40-year average rainfall, or "hydroperiod" for Hilton Head Island is 51 inches per year (acre-inches). This is the Baseline against which to compare the sum of annual RW loading plus rainfall in inches as recorded by HHPSD.

In 2016-2017 Hilton Head Public Service District recorded 110.4 inches of rainfall, or 55.2 inches per annum over the two-year span. This amount of rain was 7% higher than the hydroperiod 50-year average of 51.4 inches annually. This difference falls within the historic range of variability.

A-2. Recycled Water Loading. Water loading for this period averaged 81.7 additional acre-inches per year in the wetlands. This supplemental influent sustained a pond-full water level in each wetland.

A-3. Depth of Surface Water. We sampled water depth in equidistant monitoring stations in the wetlands. Averaged between the growing and dormant season, the depth of surface water was 7 inches in Cypress Conservancy and 10 inches in Whooping Crane Conservancy. The Whooping Crane Conservancy is the lowest of the two wetlands. Hence, it is the deepest and largest biologically active wetland.

A-4. Flooding observed. Perimeter soils around Whooping Crane Conservancy were saturated but there was no standing water.

A-5. Distribution of Water in the Wetlands. Surface water was observed throughout 100 percent of each wetland. This continues the trend seen since October, 2015.

Parameter B. Canopy Species

B-1. Basal Area of Trees. The basal area of trees in Whooping Crane and Cypress wetlands declined by an estimated 20%. This decline is predominately due to the loss of young hardwood and pines along the periphery of the wetlands. Peripheral trees include: sweetgum, red maple, water oak and loblolly pines. These trees were felled in the north-facing sector of the wetlands because they were most exposed to the storm winds from Hurricane Matthew in October, 2016. These trees acted as a sacrificial buffer, but the interior swamp forest lost very few trees.

B-2. Density of Canopy Trees. The decline of canopy species in the Cypress and Whooping Crane wetlands was estimated at 5%. As stated above, the old growth hardwoods were most resilient in the face of the hurricane-force winds. Trees that were felled were mostly secondary trees exposed on the perimeter of the wetland and growing under larger trees. The giants of the wetland are native swamp blackgums and several rare bald cypress trees. They have survived many storms, including Hurricane Matthew.

B-3. Importance Value of Canopy Species. Importance value is the sum of dominance, density, frequency and wildlife habitat opportunity for species in an ecological community. This 0-100 point valuation is useful for tracking maturation or degradation of species in the RW wetlands. The Cypress Conservancy ranks a 60-point assessment because it is a maturing community yet constrained by impacts such as drought, tree-fall and the regular dry-down requirement, which has led to marked windfall of semi-mature trees. Whooping Crane Conservancy ranks 95 points because it is at peak maturity and biodiversity. It continues to be significantly resilient against natural impacts such as drought, flood and wind, and has no dry-down restriction.

Parameter C. Shrub and Groundcover Species

C-1. Species Diversity. The diversity of species did not change in this recent period of biennial monitoring. The Hurricane had no impact on groundcover vegetation, including dominance, density and importance value. Whooping Crane Conservancy is the largest and deepest of the wetlands. This condition allows for a high population of groundcover but restricts species diversity due to the depth of water. Species with highest importance value were: duckweed, marsh pennywort, sedge species, and lizard's tail. Cypress Conservancy species diversity included: marsh marigold, lizard's tail, duckweed, marsh pennywort, sedge species and blueflag iris. A relatively new aspect of groundcover: the local niches where fallen trees opened up new areas on the ground to sunlight and open water for new growth.

C-2. Total Cover of Dominant Species. Total cover of the water and/or ground surface was 60% in Cypress Conservancy and 100% in Whooping Crane Conservancy. The different cover totals reflect the difference in size, topography, depth and RW loading between the two wetlands--in particular the dry down affect in Cypress.

Parameter D. Nuisance Plant Species

During monitoring of the Cypress and Whooping Crane Conservancy wetlands we did not observe any Federally or South Carolina listed "nuisance species" (invasive, exotic, parasitic, or toxic species) in the project wetlands. It is probable that higher surface water in the wetlands controlled the invasion or spread of other such nuisance species. In past years we reported that Chinese tallow-tree (*Sapium sebiferum*), an invasive-exotic tree species had been growing in the perimeter areas of the wetlands. In recent monitoring we did not see tallow trees in either wetland.

Parameter E. Exceeding the Threshold of Concern for a Parameter: Canopy

This monitoring parameter describes changes in canopy species—mature trees in the wetland. The change in species dominance in the wetland is measured by relative dominance (calculated by basal area, change in density, and/or loss due to natural causes).

In the most recent monitoring period in this canopy strata was impacted by hurricane force winds, leading to blowdown of trees and alteration of surface water flow by limbs, branches and stacks of tree trunks. This impact occurred predominantly in the north edge of Cypress Conservancy.

Parameter F. Exceeding the Threshold of Concern for a Parameter: Shrub and Groundcover

The shrub and groundcover vegetation has remained resilient and diverse in spite of Hurricane Matthew and dry down periods. In fact, the hurricane supplied surplus water to offset the dry down in Cypress swamp. In Whooping Crane Conservancy the 100% coverage by water enabled diverse plant life to sustain and expand, producing productive habitat for fish and wildlife. Shrub and groundcover sustained growth throughout the monitoring period and did not decline in the wetlands at a rate exceeding the threshold of concern. We predict continued new growth and expansion of this stratum.

Parameter G.

Natural Causes

In 2016-2017, natural causes did not exceed the threshold of concern for the wetland strata. The RW operations did not add to flooding or any degradation of the wetlands. The Cypress and Whooping Crane Conservancies are highly functional and resilient. They have recovered at a normal rate since the hurricane.

Paramenter H.

Benthic Macro-Invertebrates

The population of benthic macro-invertebrates is very similar to past years. Species diversity was also similar, however, the areas of blow-down from the 2016 hurricane provide abundant cover for macro-invertebrates including borers that consume deadwood. If the population of borers expands, this could cause some reduction of wetland trees. At this time, we have not seen indications of borers in the wetland forest.

Parameter I. Fish The high level of water observed in the wetlands provided ample habitat for fish species. However, the diversity of fish species is limited by the overall small acreage of the wetlands. We did observe wading birds hunting fish in the shoals of both wetlands.

Parameter J.

Endangered, Threatened and Rare Species

In the course of monitoring we have identified a wide variety of wildlife, including past endangered species. Currently, candidate species listed for South Carolina, and that may occur in the Cypress Conservancy or Whooping Crane Conservancy include, but are not limited to, Bachman's Warbler, Bicknell's Thrush, Carolina heel spitter, Eastern wood stork, Edisto Crayfish, gopher tortoise, Henslow's Sparrow, and Kirtland's wood Warbler. These species did not occur in the most recent monitoring. Additional listed vegetation species for South Carolina include: American chaff-seed and pond spice. During the most recent monitoring we did not observe any of these listed species.

Parameter K. No Discharge Period in RW Projects

In 2016, a dry-down period did not occur in Cypress Conservancy. In 2017 there was a dry-down period between January and November. Nevertheless, Cypress Conservancy was inundated with a variable depth of water. Whooping Crane Conservancy has no dry-down period and has been continually pond-full.

Conclusions and Recommendations

This report has summarized the monitoring results in the Recycled Water projects in the Cypress Conservancy and Whooping Crane Conservancy in Hilton Head Plantation, Hilton Head Island, SC. The monitoring took place in 2016-2017 in the dormant and growing seasons. Monitoring protocol followed specifications in the NPDES Permit documents.

Conclusions

1. The foremost incidents affecting the biology of the Hilton Head Plantation RW Projects were surface water rise and blow down of trees primarily on the north-northwest end of the wetlands. This impact was most evident in Cypress Conservancy.

Recommendations

2. Whooping Crane Conservancy was highly resilient to Hurricane Matthew and other climatic conditions. We observed no lasting impacts in any strata of the wetland. The absence of dry down in Whooping Crane has protected this swamp-forest from the blow-down experienced in Cypress Conservancy.

3. The Cypress Conservancy that has been subject to recurring dry-down for decades, experienced a higher loss of trees and moderate blockage of waterflow from blowdown. The decades of dry-down has exposed this wetland to a higher level of tree-fall, primarily due to desiccated soil and storm-wind.

1. Continue the monitoring program to assure the most affective management of recycled water in the wetlands.

2. Continue to share monitoring results with authorities in Hilton Head Plantation and provide understandable information to community residents.

3. As part of ongoing public relations, include critical information about benefits of the RW programs which buffer storm-wind, provide water storage to minimize flooding, and enhance wildlife.

4. In coordination with SC DHEC establish a pilot program to eliminate dry-down, and instead, allow managed, regular flow into Cypress Conservancy. We believe that this would reduce tree fall in the wetland.

6. Glossary

Adsorption Accumulation of liquids or solids on the surface of leaves.

Basal Area The cross-sectional area of a tree trunk measured in square inches or square feet at 4.5 feet above ground.

Biennial A duration of two years.

Bottomland A low terrain that contains freshwater or a high water table.

Colonial Wading Birds Herons, egrets and ibises and other long-legged water birds that nest in dense communities called "rookeries."

Cover The degree to which above-ground portions of vegetation cover the ground surface. Also called areal cover.

Cypress Bald cypress and pond cypress are long-living, cone-bearing members of the Redwood Family. Cypress Conservancy is the only large stand of native cypress trees on Hilton Head Island.

Dominance The measure of a plant species compared with other species, based on areal cover (groundcover) and caliper inches converted to basal area (trees).

Density The number of individuals of a species per unit area.

Dry-down A mandated period in which no recycled water flows into a wetland.

Drought A period of abnormally low rainfall that affects growing or living conditions.

Ecological Succession The process in which communities of plant and animal species in a particular area are replaced over time by a series of different and more complex communities.

Endangered Species A species of plant or animal that is in danger of going extinct.

Emergent Plant A plant with its lower part underwater and its upper part, usually leaves and flowers, above the water surface.

Evapotranspiration The process in which water is changed into vapor by atmospheric pressure, wind, humidity, solar radiation, and released through plant leaves and bark.

Frequency The distribution of individuals of a plant species in an area.

Growing Season The portion of the year that is frost-free.

Habitat A place where a plant or animal lives. A productive habitat provides sufficient food, cover and water.

Hardwood A broad-leaved tree such blackgum, red maple, or sweet gum.

Hydrology The properties, distribution and circulation of water.

Hydroperiod The average annual cycle of rainfall of a location.

Importance Value The relative influence of a plant species in a plant community, obtained by summing relative dominance, density and frequency.

Indicator Species A species that indicates whether an ecosystem is vibrant or degrading.

Keystone Species A species that affects other species in a community.

Macro-Invertebrate An animal species lacking a backbone and which can be seen without the aid of optical magnification.

Neotropical The geographic region including Central and South America.

NPDES National Pollution Discharge System permit under the Clean Water Act.

Palustrine A freshwater community.

Recycled Water Advanced-treated domestic water discharged into wetlands to restore ecological functions, values, wildlife habitat, and human recreation opportunities. Formerly named "reclaimed water."

Surface Plant A species of vegetation that keeps leaves above the surface of the water.

Wetland An area that is inundated or saturated by surface or ground water at a frequency and duration to support vegetation adapted to saturated or flooded soil.

Common Yellow-shafted Flicker	Colaptes auratus
Eastern Bluebird	Sialia sialis
Great Blue Heron	Ardea herodias

Great Crested Flycatcher Great Egret Great Horned Owl Green-backed Heron Moorhen (Common Gallinule) Northern Cardinal Osprey Peregrine Falcon Pileated Woodpecker Red-bellied Woodpecker Red-bellied Woodpecker Red-winged Blackbird Red-shouldered Hawk Ruby-throated Hummingbird Rufous-sided Towhee Snowy Egret Myiarchus crinitus Casmerodius albus Bubo virginianus Butorides striatus Gallinula chloropus Cardinalis cardinalis Panodiun haliaetus Falco peregrinus Dryocopus pileatus Melanerpes carolinus Agelaius phoeniceus Buteo lineatus Archilochus colubris Pipilo erythrophthalmusi Egretta thula

Tufted Titmouse	Parus bicolor
Turkey Vulture	Cathartes aura
Yellow-billed Cuckoo	Coccyzuz americanus
Yellow-rumped Warbler	Dendroica coronata
Wood Duck	Aix sponsa
Wood Stork	Mycteria americana
White Ibis	Eudocimus albus

Fish: 1 Species

Eastern Mosquitofish

Gambusia affinis

Mammals: 4 Species

Eastern Gray Squirrel

Raccoon

River Otter

White-tailed Deer

hiltonensis

Sciurus carolinensis Procyon lotor Lutra canadensis Odicoileus virginianus-

Reptiles: 4 Species

American Alligator mississippiensis Alligator

Eastern Cottonmouth piscovorus Green Anole Yellow-bellied Slider scriptai Agkistrodon piscivorus-

Anolis carolinensis carolinensis Chrysemys scripta

Macro-InvertebrateS

Arachnids: 9 Species

American Dog Tick Forest Wolf Spider Dwarf Spider Golden Silk Spider Pirate Wolf Spider Red Freshwater Mite Six-spotted Fishing Spider Wasp Spider Water Mite Dermacento variablis Lycosa gulosa Mycriphantinae sp. Nephila clavipes Pirata piraticus Limnocharus americana Dolomedes triton Halcti sp. Hygrobates sp.

Crustaceans: 4 Species

Scud	Gammarus fasciatus
Scud	Hyalella asteca
Sow Bug	Oniscus asellus

Water Flea

Daphnia pulex

Aconicta americana

Camponotus

Insects: 35 Species

American Dagger Moth Black Carpenter Ant pennsylvanicus Black Fly Black Salt marsh Mosquito Citrine Forktail Damselfly Chironomid Midge Condylostylid Long-legged Fly **Common Water Strider** Crawling Water Beetle Deerfly Eastern Malaria Mosquito Eastern Tent Moth Field Cricket Green Clearwing Dragonfly Green Darner Dragonfly Green Midge House Fly Leaf Beetle Lightning Bug Marsh Fly Meadow Grasshopper

Simulium sp. Aedes taenorhynchus Ischnura hastata Chironomid sp. Condylostylid sp. Gerris remigis Peltodytes lengi Chrysops sp. Aedes quidrimaculatus Malicosma americanum Gryllus pennsylvanicus Erythemis simplicollis Anax junius Tanytarsus sp. Musca domestica Donacia sp. Lampyrid sp. Tetanocera sp. Convuphalinae sp.

Net-winged Damselfly
Pale Bluet Dragonfly
Periodical Cicada
Plant Bug
Planthopper
Red Skimmer Dragonfly
Shore Fly
Southern House Mosquito
quinquefaxciatus
Spotless Nine-spotted Ladybug
franciscana
Swift Long-winged Skimmer
Thrip
Water Scorpion
Water Strider – Broad-shouldered
Whirligig Beetle

Argia sp.
Enallagma hastata
Magicicidada sp.
Mirid sp.
Delphacid sp.
Libellula saturata
Ephyrdid sp.
Culex pipiens
Coccinella novemnota
Pachydiplax longipennis
Thysanoptera sp.
Ranatra sp.

Microvelia borealis Dineutes americanas

Isoptera: 1 Species

Eastern Subterranean Termite

Reticulitermes flavipes

Worms: 2 Species

Earthworm

Flatworm

Lumbricus terristis. Dugesia tigrina

Mollusks: 3 Species

Hairy Wheel Snail Little Pond Snail Winkle Snail Gyraulus hirsutus Amnicola limnosa Vivaparus intertextus

Total: 100 Species
